BACKGROUND INFORMATION

EphA2 (Ephrin type-A receptor 2) is a receptor tyrosine kinase involved in cell adhesion, migration, and tissue organization. It plays a critical role in embryonic development and angiogenesis. EphA2 is frequently overexpressed in various cancers, including breast, lung, and prostate cancer. Overexpression is associated with increased tumor growth, invasiveness, and poor clinical outcomes. Because of its role in promoting tumor progression, EphA2 is being actively explored as a therapeutic target in oncology. Therapeutic strategies include monoclonal antibodies, small molecule inhibitors, and antibody-drug conjugates targeting EphA2-positive tumors.
